# Link Analysis: HITS & Page Rank

Advanced Social Computing

Department of Computer Science University of Massachusetts, Lowell Fall 2020

Hadi Amiri <u>hadi@cs.uml.edu</u>

### Ranking Problem

- We already know that there is considerable variation in the connectivity and structure of nodes in networks.
- How can we find nodes that are potentially more "important" or "authoritative" than others?

### Ranking Problem- Cnt.

#### • Web Ranking Problem:

 Given the Web and a query, rank Web pages with respect to the query such that the most relevant pages to the query appear higher in the list.

About 104,000,000 results (0.23 seconds)

#### Turtle - Wikipedia, the free encyclopedia

en.wikipedia.org/wiki/Turtle 
Wikipedia 
Turtles are reptiles of the order Chelonii or Testudines characterised by a special bony or cartilaginous shell developed from their ribs and acting as a shield. Leatherback sea turtle - Terrapin - Plastron - Cryptodira

#### The Turtles - Wikipedia, the free encyclopedia

en.wikipedia.org/wiki/The**\_Turtles \*** Wikipedia \*

The **Turtles** are an American rock band led by vocalists Howard Kaylan and Mark Volman, later known as Flo and Eddie. The band became notable for several ...

#### Turtle & Tortoise | San Diego Zoo Animals

animals.sandiegozoo.org/animals/turtle-tortoise 
 San Diego Zoo 
 All turtles, tortoises, and terrapins are reptiles. Scientists often refer to them as chelonians, because they are in the taxonomic order called Chelonia (from the ...

#### Green Sea Turtle - National Geographic

animals.nationalgeographic.com/.../green-tu... 

National Geographic Society 
Learn all you wanted to know about green turtles with pictures, videos, photos, facts, 
and news from National Geographic.

#### Title for Teenage Mutant Ninja Turtles Sequel Revealed?

ComingSoon.net - 5 hours ago Production on the upcoming Teenage Mutant Ninja Turtles sequel is gearing up for ...

### Lecture Topics

- HITS
- Spectral Analysis of HITS
- Page Rank
- Spectral Analysis of Page Rank

#### HITS

- Hyperlink-Induced Topic Search (HITS)
   A Link analysis algorithm for ranking nodes.
- Links are essential for ranking
  In-links could be considered as endorsements!
- In aggregate, if a node receives many links from other (important) nodes, then its is receiving **collective endorsement**!

• Q: newspaper

**Experts** vote for many authoritative pages!

- these pages may have some sense of where the good answers are
- Score them highly

# UMASS

## HITS- Cnt.

- Interesting Web pages fall into two categories:
- **1. Authorities** that are pages containing relevant information
  - Newspapers homepages
  - Universities homepages

#### **2. Hubs** are pages that link to authorities

- Lists of newspapers
- Directories

- A good hub?
  - links to many good authorities

#### A good authority?

• is linked from many good hubs

We use two scores for each node
Hub score and Authority score

# UMASS

#### • Authority Score:

For each page p is the sum of the hub scores of all pages that point to it.

# eauth(p)

#### • Hub Score:

For each page p is the sum of the authority scores of all pages that it points to.

*hub*(p)

#### Authority Update Rule:

 For each page p, update *auth*(p) to be the sum of the hub scores of all pages that point to it.

 For each page p, update *hub*(p) to be the sum of the authority scores of all pages that it points to.

#### <u>Algorithm</u>

- 1. Set all hub scores and authority scores to 1.
- 2. Choose a number of steps *k*.
- 3. Perform a sequence of *k* hub-authority updates:
  - 1. First apply the Authority Update Rule to the current set of scores.
  - 2. Then apply the Hub Update Rule to the resulting set of scores.
- 4. Normalize authority and hub scores

- What happens if we run HITS for larger and larger values of *k*?
  - The normalized values converge to limits as k goes to infinity!
    - Values stabilize; further updates lead to smaller and smaller changes in the values we observe!

- Spectral Analysis of Page Rank

### Spectral Analysis of HITS

- Let  $M_{ij} \in n \times n$ 
  - denote the adjacency matrix of our Web page sample!
    - If there is a directed edge from page *i* to page *j* 
      - M<sub>ij</sub>= 1
    - Otherwise
      - $M_{ij} = 0$

- Let  $M_{ij} \in n \times n$ 
  - denote the adjacency matrix of our Web page sample!
- Represent Hub and Authority scores by two ndimension vectors
  - Hub:  $h \in n \times 1$ 
    - $h_i$  represents the hub score of node i
  - Authority:  $a \in n \times 1$ 
    - $a_i$  represents authority score of node i

- Hub Update Rule:
  - For each page *i*, update *h<sub>i</sub>* to be the sum of the authority scores of all pages that it points to.

$$h_i \leftarrow M_{i1}a_1 + M_{i2}a_2 + \dots + M_{in}a_n,$$

#### • Authority Update Rule:

 For each page *i*, update *a<sub>i</sub>* to be the sum of the hub scores of all pages that point to it.

$$a_i \leftarrow M_{1i}h_1 + M_{2i}h_2 + \dots + M_{ni}h_n.$$

• Unwinding the *k*-step hub-authority computation

• Let

- $a^{<o>}$  initial vector of authority scores
- $h^{<o>}$  initial vector of hub scores
- Compute a<sup><k></sup> and h<sup><k></sup> vectors!

$$k=1 \quad a^{\langle 1 \rangle} = M^T h^{\langle 0 \rangle}$$

$$h^{\langle 1 \rangle} = M a^{\langle 1 \rangle} = M M^T h^{\langle 0 \rangle}$$

$$k=2 \quad a^{\langle 2 \rangle} = M^T h^{\langle 1 \rangle} = M^T M M^T h^{\langle 0 \rangle}$$

$$h^{\langle 2 \rangle} = M a^{\langle 2 \rangle} = M M^T M M^T h^{\langle 0 \rangle} = (M M^T)^2 h^{\langle 0 \rangle}$$

$$\begin{aligned} \mathbf{k} &= \mathbf{3} \\ \mathbf{k} &= \mathbf{3} \end{aligned} \overset{\langle 3 \rangle}{=} M^T h^{\langle 2 \rangle} = M^T M M^T M M^T h^{\langle 0 \rangle} = (M^T M)^2 M^T h^{\langle 0 \rangle} \\ h^{\langle 3 \rangle} &= M a^{\langle 3 \rangle} = M M^T M M^T M M^T h^{\langle 0 \rangle} = (M M^T)^3 h^{\langle 0 \rangle} \end{aligned}$$

$$a \leftarrow M^T h.$$
$$h \leftarrow M a.$$

• Unwinding the *k*-step hub-authority computation

$$a^{\langle k \rangle} = (M^T M)^{k-1} M^T h^{\langle 0 \rangle}$$

$$h^{\langle k \rangle} = (MM^T)^k h^{\langle 0 \rangle}$$

• Do they converge to stable values?

- Magnitude of hub and authority scores grow with each update.
- They only converge when we normalize them!
- In fact, it is the directions of the hub and authority vectors that are converging
  Why?

 $c^k$ 

• There are normalization constants *c* and *d* so that the following vectors converge to limits as *k* goes to infinity.  $h^{\langle k \rangle} \qquad a^{\langle k \rangle}$ 

 $d^k$ 

• Let's focus on *hub* vectors (same for authority vectors)!

$$h^{\langle k \rangle} = (MM^T)^k h^{\langle 0 \rangle}.$$

$$\frac{h^{\langle k \rangle}}{c^k} = \frac{(MM^T)^k h^{\langle 0 \rangle}}{c^k}$$

• This

$$\frac{h^{\langle k \rangle}}{c^k} = \frac{(MM^T)^k h^{\langle 0 \rangle}}{c^k}$$

- converges to limit h<\*>, thus
  - the direction of  $h^{<*>}$  at the limit should not change when multiplied with  $MM^T$
  - Though it's length may change by a factor of *c*.

$$(MM^T)h^{\langle * \rangle} = ch^{\langle * \rangle}.$$

- **Definition 1**: vector *v* is an **eigenvector** of matrix **X** if:
  - $\mathbf{\nabla} \mathbf{X} \boldsymbol{\upsilon} = \lambda \boldsymbol{\upsilon}$
  - $\boldsymbol{v}$  an **eigenvector** of **X** and  $\lambda$  is its **eigenvalue**.
- $h^{<*>}$  has to be an eigenvector of  $MM^T$ .

$$(MM^T)h^{\langle * \rangle} = ch^{\langle * \rangle}.$$

• **Definition 2:** Any *n* × *n* **symmetric matrix** has a set of *n* eigenvectors that are unit vectors and mutually orthogonal

• they form a basis for the space  $\mathbb{R}^n$ .

 $\mathbf{X} = \mathbf{X}^{\mathrm{T}}$ 

- *MM<sup>T</sup>* is symmetric!
  - Thus *MM<sup>T</sup>* has *n* eigenvectors *v*<sub>1</sub>, *v*<sub>2</sub>, ..., *v*<sub>n</sub> with corresponding eigenvalues λ<sub>1</sub>, λ<sub>2</sub>, ..., λ<sub>n</sub>
    - Let's assume that:  $|\lambda_1| > |\lambda_2| >=... >= |\lambda_n|$
  - Given any vector *u*, a good way to think about (*MM<sup>T</sup>*)*u* is to first write *u* as a linear combination of (*MM<sup>T</sup>*)'s eigenvectors!
    - $h^{\langle k \rangle} = (MM^T)^k h^{\langle 0 \rangle}$  $h^{\langle k \rangle} = (MM^T)^k h^{\langle 0 \rangle}$
    - $h^{<k>} = (MM^T)^k (q_1 v_1 + ... + q_n v_n) =$
    - $h^{\langle k \rangle} = q_1 (MM^T)^k v_1 + ... + q_n (MM^T)^k v_n =$
    - $h^{\langle k \rangle} = q_1(\lambda_1)^k \boldsymbol{v}_1 + \dots + q_n(\lambda_n)^k \boldsymbol{v}_n$

- $h^{\langle k \rangle} = q_1(\lambda_1)^k \boldsymbol{v}_1 + q_2(\lambda_2)^k \boldsymbol{v}_2 + \dots + q_n(\lambda_n)^k \boldsymbol{v}_n$ •  $|\lambda_1| > |\lambda_2| > = \dots > = |\lambda_n|$
- $h^{\langle k \rangle} / (\lambda_1)^k = q_1 \boldsymbol{v}_1 + q_2 (\lambda_2 / \lambda_1)^k \boldsymbol{v}_2 + \dots + q_n (\lambda_n / \lambda_1)^k \boldsymbol{v}_n$ 
  - What does happen if k go to infinity?
    - every term except the first goes to o!
    - Therefore,  $h^{< k>} / (\lambda_1)^k$  converges to  $\mathbf{q}_1 \boldsymbol{v}_1$
- Remaining steps:
  - Relaxing  $|\lambda_1| > |\lambda_2| >=... >= |\lambda_n|$
  - See book: pages 372-374

### HITS- Recap

#### Algorithm

- 1. Set hub and authority scores to 1.
- 2. Choose a number of steps *k*.
- 3. Perform k hub-authority updates:
  - 1. Apply AUR to the current set of scores.
  - 2. Then apply HUR to the resulting scores.  $h^{\langle k \rangle} = (MM^T)^k h^{\langle 0 \rangle}$ .
- 4. Normalize authority and hub scores
- AUR: Authority score of page p: • sum of the hub scores of pages that point to p.
- HUR: Hub Score of page p: sum of the authority scores of pages that p points to.

$$a^{\langle k \rangle} = (M^T M)^{k-1} M^T h^{\langle 0 \rangle}$$

#### Lecture Topics

- HITS
- Spectral Analysis of HITS
- Page Rank
- Spectral Analysis of Page Rank

#### Page Rank

- A page is important if it is linked / endorsed by other important pages (iterative process)
  - dominant mode of endorsement among
    - academic or governmental pages,
    - bloggers,
    - scientific literature, or even
    - personal pages!
- Each node has one score, **PageRank score**!
- Votes / Endorsements pass directly from one page to another (across outgoing links)!

#### make stronger en

Page Rank- Cnt.

# Its current PageRank score. Nodes that are currently viewed as more important make stronger endorsements.

• The weight of a node's endorsement:

#### 35

- PageRank Update Rule:
  - 1. Each page divides its current PageRank equally across its out-going links
    - passes **equal shares** to the pages it points to.
    - If a page has **no out-going** links, it passes all its current PageRank to itself.
  - 2. Each page updates its new PageRank to be the sum of the shares it receives.

#### <u>Algorithm</u>

- 1. Set initial PageRank of all nodes to 1/n.
- 2. Perform *k* updates to the PageRank values:
  - 1. Apply PageRank Update Rule

- PageRank intuitive view:
  - *"fluid*" that circulates through the network
  - passing across edges, and
  - pooling at the nodes that are the most important!

• Sum of PageRank values in the network?

- Sum of PageRank values in the network?
  - Remains constant as PageRank is never created nor destroyed!
    - just moved around from one node to another.
  - Each page takes its PageRank, divides it up, and passes it along links
- We don't need to normalize values anymore!
  In contrast to HITS!

- n=8
- Initially  $p_i = 1/8$  for all nodes

Step	А	В	С	D	Е	F	G	Н
1	1/2	1/16	1/16	1/16	1/16	1/16	1/16	1/8
2	3/16	1/4	1/4	1/32	1/32	1/32	1/32	1/16

A acquires a lot of PageRank B and C benefit in the next step. B and C are more important than D, E, F, G, and H

#### **Equilibrium Values of PageRank**

When we reach the limiting PageRank values:

- 1. PageRank values sum to 1, and
- 2. If we apply the PageRank Update Rule, the values at every node remains the same
  - values regenerate themselves exactly when they are updated.

• Issue with page rank algorithm?

#### 44

#### Page Rank- Cnt.

- Issue with page rank algorithm?
  - "Wrong" nodes can end up with all the PageRank in the network!

F and G point to each other!

PageRank that flows from C to F and G can never circulate back into the rest of the network

For large k, PageRank values converge to 1/2 for each of F and G, and O for all other nodes.

The links out of C function as a kind of "**slow leak**" that eventually causes all the PageRank to end up at F and G.

- Issue with page rank algorithm?
  - "Wrong" nodes can end up with all the PageRank in the network!

As long as there are small sets of nodes that can be reached from the rest of the graph, but have no paths back, then PageRank will build up there!

- Link farms
  - Pages heavily linked to each other
  - Created by automated programs
  - Fooling search engines

- Scaled PageRank Update Rule:
  - Pick a scaling factor 0 < *s* < 1</li>
  - Apply the PageRank Update Rule as before.
  - Then scale down all PageRank values by a factor of *s*.
    - The total PageRank in the network?
      - shrinks from 1 to s.
  - Divide residual (1-s) PageRank equally over nodes
    - giving (1- s) /n to each node.

Common values for *s* are in the range of 0.8 to 0.9!

#### The above rule follows from the "fluid" intuition for PageRank

- Why all the water on earth doesn't inexorably run downhill and reside exclusively at the lowest points?
- There's a counter-balancing process at work:
- Water also evaporates and gets rained back down at higher elevations!

- Repeated application of the Scaled PageRank Update Rule **converges** to a set of limiting PageRank values as *k* goes to infinity!
- Do the resulting values depend on the choice of *s*?
  Yes, different update rules for different values of *s*.

#### Lecture Topics

- HITS
- Spectral Analysis of HITS
- Page Rank
- Spectral Analysis of Page Rank

#### PageRank Update Rule

- Let N<sub>ij</sub> to be the portion of i's PageRank that circulate to j in one update step:
  - $\mathbf{N}_{ij} = \mathbf{0}$  if *i* doesn't link to *j*
  - $\mathbf{N}_{ij} = 1/l_i$  Otherwise
    - Where  $l_i$  is out-degree of i
  - If *i* has no outgoing links, then we define  $N_{ii} = 1$ 
    - A node with no outgoing links passes all its PageRank to itself

Figure 14.13: The flow of PageRank under the Basic PageRank Update Rule can be represented using a matrix N derived from the adjacency matrix M: the entry  $N_{ij}$  specifies the portion of *i*'s PageRank that should be passed to *j* in one update step.

•  $r \in n \times 1$ 

- vector representing PageRanks of all n nodes
- PageRank Update Rule:

$$r_i \leftarrow N_{1i}r_1 + N_{2i}r_2 + \dots + N_{ni}r_n.$$

#### **Scaled PageRank Update Rule**

- Let Ñ<sub>ij</sub> to be the portion of i's PageRank that circulate to j in one update step:
  - The updated PageRank is scaled down by a factor of *s*, and the residual (1 s) units are divided equally over all nodes

$$r_i \leftarrow \tilde{N}_{1i}r_1 + \tilde{N}_{2i}r_2 + \dots + \tilde{N}_{ni}r_n.$$

$$r \leftarrow N^T r.$$

- Start from an initial PageRank vector  $r^{<0>}$  and produce a sequence of vectors  $r^{<1>}$ ,  $r^{<2>}$ , ... each is obtained from the preceding one via multiplication by  $\mathbf{\tilde{N}}^{\mathrm{T}}$ .
  - Unwind this process:

$$r^{\langle k \rangle} = (\tilde{N}^T)^k r^{\langle 0 \rangle}.$$

• The Scaled PageRank Update Rule converges to a limiting vector  $r^{<*>}!$ 

$$\tilde{N}^T r^{\langle * \rangle} = r^{\langle * \rangle}$$

*r*<sup>\*></sup> should be an eigenvector of Ñ<sup>T</sup> with eigenvalue of 1.
See book: page 376.

#### 55

#### Applications

#### • Impact Factor of Scientific Journals

**Impact Factor** for a scientific journal: The average number of citations received by papers published in the given journal over the past two years.

In-links indicate **collective attention** that the scientific community pays to papers published in the journal.

Lymph nodes (reg)

Lymph nodes (dist) Omentum

Pancreas

Pericardium

Peritonium

#### **Applications- Cnt.**

#### • Fighting Lung Cancer Using PageRank

metastatic lung cancer does not progress in a single direction from primary tumor site to distant locations, which has been the traditional medical view. Instead ... cancer cell movement around the body likely occurs in more than one direction at a time.

certain organs tend to spread **cancer cells** more aggressively, while others tend to act as sponges for cancer cells!

Diaphragm

Large intestine

Kidney

Heart

Gallbladder

Brain

Bone

#### Applications- Cnt.

#### Applying PageRank to the Molecular Universe

Because the **PageRank of a molecule affects how it will act in a chemical reaction** — and water is involved in almost every biological process. By understanding how a network of trillions of molecules interact, scientists can produce much more accurate models of chemical reactions.

#### Applications- Cnt.

#### Google trick tracks extinctions

Google's algorithm for ranking web pages can be adapted to **determine** which species are critical for sustaining ecosystems.

Modification of food webs from ecological considerations to satisfy the two constraints required for application of the algorithm.
