Lecture Topics

- Graph Theory
 - Node degree
 - Graph density
 - Complete Graph
 - Distance and Diameter
 - Adjacency matrix
 - Graph Connectivity
 - Reachability
 - Sub-graphs
 - Graph Types

Terminology

- Graph terminology is often derived from transportation metaphors
 - E.g. “shortest path”, “flow”, “diameter”

(a) Airline routes

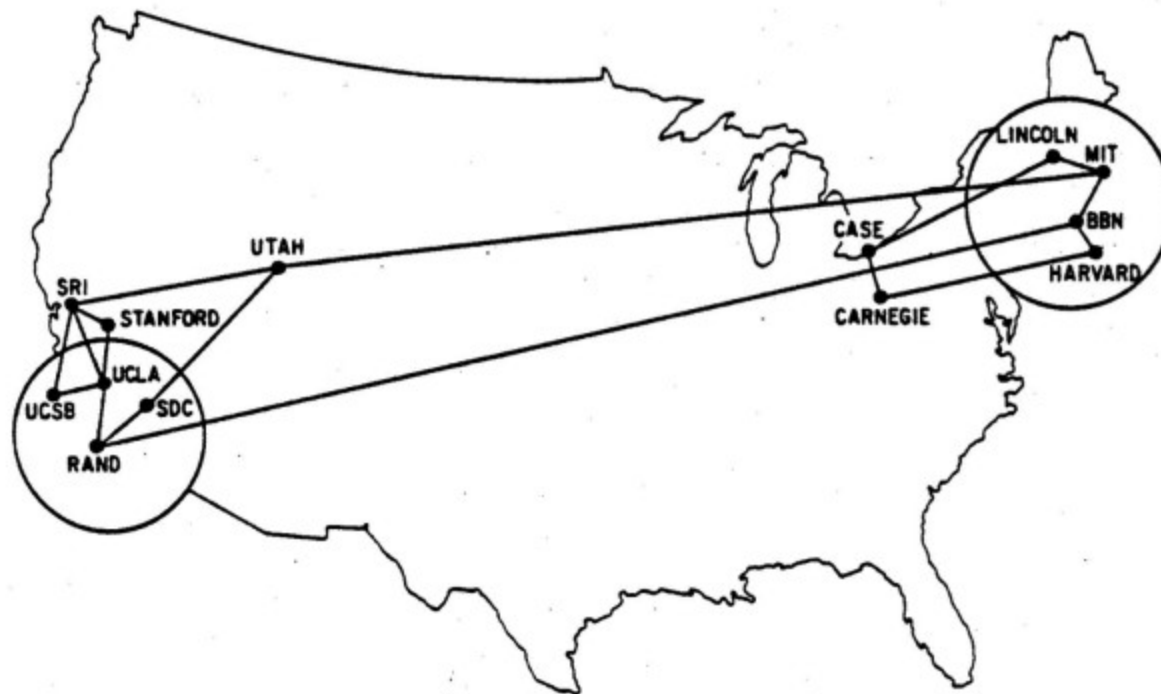

(b) Subway map

Graphs as Models of Networks

- Abstract graph theory is interesting in itself
- But in network science, items typically represent real-world entities
 - **Examples**
 - Communication networks
 - Companies, telephone wires
 - Social networks
 - People, friendship/contacts
 - Information networks
 - Web sites, hyperlinks

Graphs as Models of Networks - Cnt.

- ARPANET: Early Internet precursor
- December 1970 with 13 nodes

Basic Graph Concepts

Graph Theory

- A graph consists of
 - **N**: a set of nodes (items, entities, people, etc), and
 - **E**: a set of links or edges between nodes

- Graph is a way to **specify relationships** / links amongst a set of nodes.

- We define
 - $N = |\mathbf{N}| \rightarrow$ size of **N**
 - $E = |\mathbf{E}| \rightarrow$ size of **E**

Graph Theory. Cnt.

- Nodes i and j are *adjacent* or *neighbors* if:
 - There is an edge btw them!
 - $i \in \mathbf{N}$
 - $j \in \mathbf{N}$
 - $(i, j) \in \mathbf{E}$

Sample Graphs 1.

- “Lives Near” Graph

nodes

	<i>Actor</i>	<i>Lives near:</i>
n_1	Allison	Ross, Sarah
n_2	Drew	Eliot
n_3	Eliot	Drew
n_4	Keith	Ross, Sarah
n_5	Ross	Allison, Keith, Sarah
n_6	Sarah	Allison, Keith, Ross

Links or edges

- $l_1 = (n_1, n_5)$
- $l_2 = (n_1, n_6)$
- $l_3 = (n_2, n_3)$
- $l_4 = (n_4, n_5)$
- $l_5 = (n_4, n_6)$
- $l_6 = (n_5, n_6)$

Graph

Node Degree $d(i)$

- Given Node i , its degree $d(i)$ is:
 - the number nodes adjacent to it.

	<i>Actor</i>	<i>Lives near:</i>	<i>Degree</i>
n_1	Allison	Ross, Sarah	2
n_2	Drew	Eliot	1
n_3	Eliot	Drew	1
n_4	Keith	Ross, Sarah	2
n_5	Ross	Allison, Keith, Sarah	3
n_6	Sarah	Allison, Keith, Ross	3

- $l_1 = (n_1, n_5)$
- $l_2 = (n_1, n_6)$
- $l_3 = (n_2, n_3)$
- $l_4 = (n_4, n_5)$
- $l_5 = (n_4, n_6)$
- $l_6 = (n_5, n_6)$

Graph Density

- How many edges are possible?

Graph Density- Cnt.

- $(N-1) + (N-2) + (N-3) + \dots + 1 = N * (N-1) / 2$

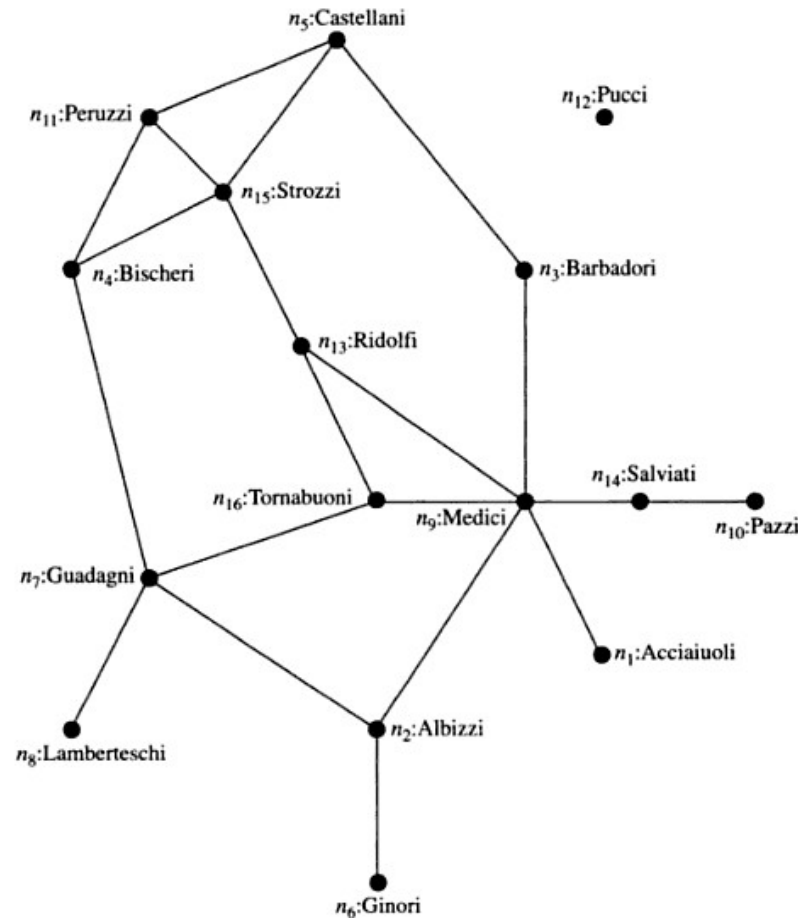

Graph Density- Cnt.

- Graph Density of a given graph G is determined by:
 - the proportion of all possible edges that are present in the graph.
 - with N nodes and E edges, graph density is:

$$\text{Density} = 2 * E / N * (N-1)$$

Graph Density- Cnt.

- What is the density of this graph?
 - $N = 16$
 - $E = 20$

Complete Graph

- If all edges are present, then all nodes are adjacent (neighbors), and the graph is a *Complete Graph*.

What is the density of a complete graph?

Distance and Diameter

- Distance btw node i and j : $d(i,j)$
 - length of the *shortest path* between i and j
- Diameter of a graph
 - the maximum value of $d(i,j)$ for all i and j

The path with min number of edges.

Distance and Diameter- Cnt.

distance

$$d(1, 2) = 1$$

$$d(1, 3) = 1$$

$$d(1, 4) = 2$$

$$d(1, 5) = 3$$

$$d(2, 3) = 1$$

$$d(2, 4) = 1$$

$$d(2, 5) = 2$$

$$d(3, 4) = 1$$

$$d(3, 5) = 2$$

$$d(4, 5) = 1$$

$$\text{Diameter of graph} = \max d(i, j) = d(1, 5) = 3$$

What is the distance and diameter of a complete graph?

Adjacency Matrix

$$A = \begin{matrix} & \begin{matrix} n_1 & n_2 & n_3 & n_4 & n_5 \end{matrix} \\ \begin{matrix} n_1 \\ n_2 \\ n_3 \\ n_4 \\ n_5 \end{matrix} & \begin{pmatrix} 0 & 1 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 \\ 1 & 1 & 0 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix} \end{matrix}$$

- Each row or column represents a node!

$$A = A^T$$

Properties of adjacency matrix \rightarrow next session

Graph Connectivity

- Indirect connections between nodes:
 - Walks
 - Trails
 - Paths

Graph Connectivity- Cnt.

- **Walk**
 - A sequence of nodes and edges that starts and ends with nodes where each node is incident to the edges following and preceding it.
- **Trail**
 - A trail is a walk with distinct edges
- **Path**
 - A path is a walk with distinct nodes & edges.
- The length of a walk, trail, or path is the number of edges in it.

Graph Connectivity- Cnt.

- Walk

- A sequence of nodes and edges that starts and ends with nodes where each node is incident to the edges following and preceding it.

Graph Connectivity- Cnt.

- Walk

- A sequence of nodes and edges that starts and ends with nodes where each node is incident to the edges following and preceding it.

Sample Walk:

$$W = n_1 l_2 n_4 l_3 n_2 l_3 n_4$$

Graph Connectivity- Cnt.

- Trail

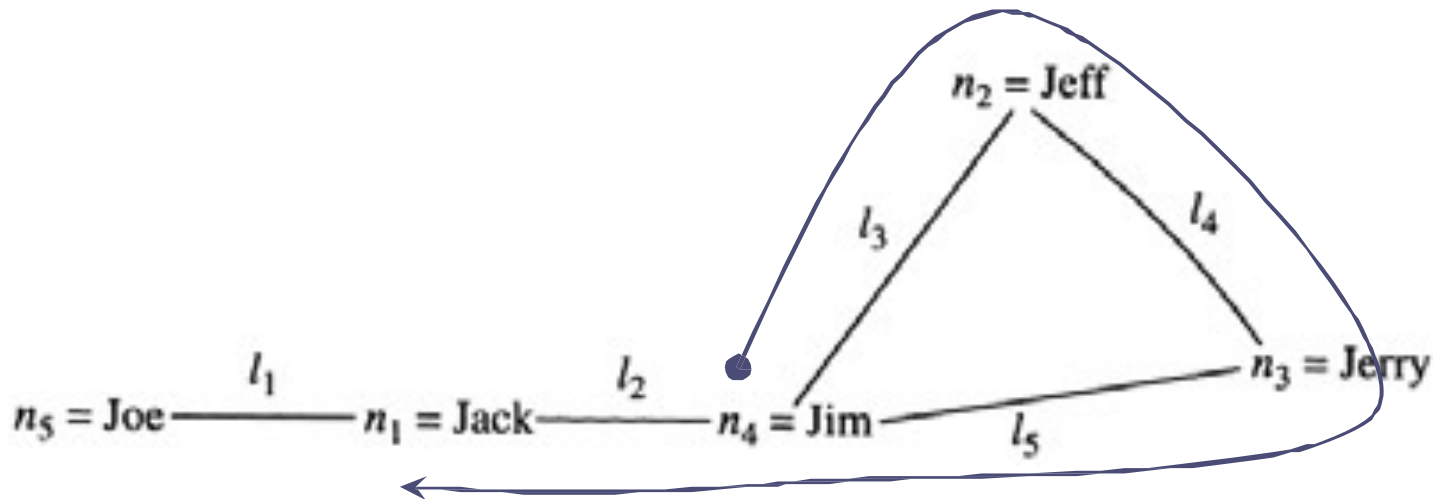

- A trail is a walk in which all edges are distinct, although some node(s) may be included more than once.

Graph Connectivity- Cnt.

- Trail

- A trail is a walk in which all edges are distinct, although some node(s) may be included more than once.

Sample Trail:

$$T = n_4 l_3 n_2 l_4 n_3 l_5 n_4 l_2 n_1$$

Graph Connectivity- Cnt.

- Path

- A path is a walk in which all nodes and all edges are distinct.

Graph Connectivity- Cnt.

- Path

- A path is a walk in which all nodes and all edges are distinct.

Sample Path:

$$P = n_1 l_2 n_4 l_3 n_2$$

Graph Connectivity- Cnt.

- Is this a Walk? Trail? Path?
 - We call a *closed walk* with distinct nodes & edges Cycle!

$n_2 l_4 n_3 l_5 n_4 l_3 n_2$

Reachability

- If there is a **path between nodes** i and j , then i and j are reachable from each other.

Connected Graph

- A graph is connected if ***every pair of its nodes*** are reachable from each other
 - i.e. there is a path between them.

Disconnected Graph

How can we make this graph connected?

Connected Graph

and this graph disconnected?

Sub-graphs

- Graph G_s is a sub-graph of G if its nodes and edges are a subset of G 's nodes and edges respectively.

Sub-graphs- Cnt.

- Graph G_s is a sub-graph of G if its nodes and edges are a subset nodes and edges of G respectively.

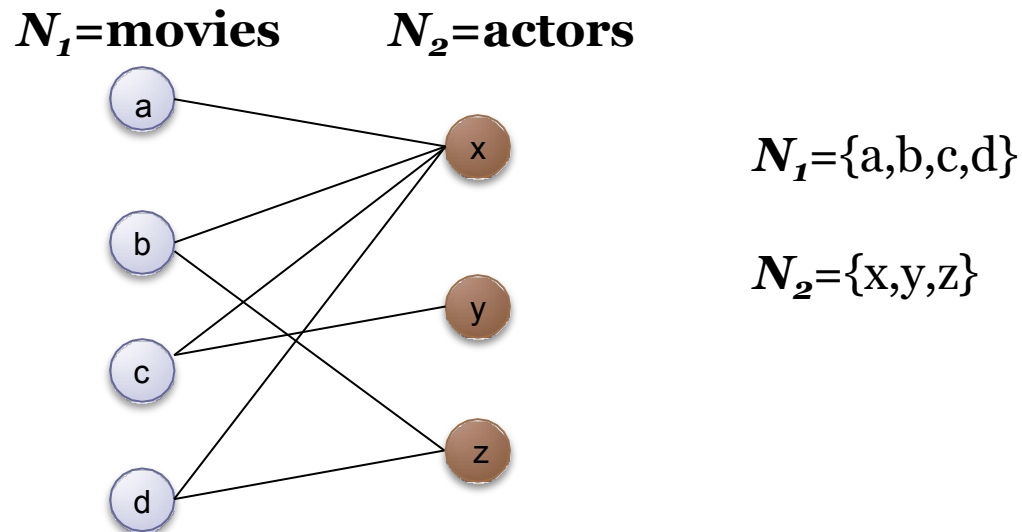

Graph Types

- Several types of graphs:
 - Bipartite graphs
 - Digraphs
 - Multigraphs
 - Hypergraphs
 - Weighted/Signed

Graph Types- Bipartite Graphs

- A bipartite graph is an undirected graph in which
 - nodes can be partitioned into two (disjoint) sets N_1 and N_2 such that:
 - $(u, v) \in E$ implies either $u \in N_1$ and $v \in N_2$ or vice versa
 - So, all edges go between the two sets N_1 and N_2 but not within N_1 or N_2 .

Graph Types- Digraphs

- Digraphs or Directed Graphs
 - Edges are directed
- Adjacency:
 - There is a direct edge btw nodes!
 - $i \in N$
 - $j \in N$
 - $(i, j) \in E$

Graph Types- Digraphs- Cnt.

- Node Indegree and Outdegree
 - Indegree
 - The indegree of a node, $d_I(i)$, is the number of nodes that link to i ,
 - Outdegree
 - The outdegree of a node, $d_O(i)$, is the number of nodes that are linked by i ,
- Indegree: number of edges terminating at i .
- Outdegree: number of edges originating at i .

Graph Types- Digraphs- Cnt.

$$d_I(n_j) = \sum_{i=1}^n A_{ij}$$

A =

0	1	0	0	1	0
0	0	1	0	0	1
0	1	0	0	0	0
0	0	0	0	1	0
0	0	0	0	0	1
0	1	0	0	0	0

0	3	1	0	2	2
---	---	---	---	---	---

$$d_O(n_i) = \sum_{j=1}^n A_{ij}$$

2
2
1
1
1
1

$$A \neq A^T$$

Graph Types- Digraphs- Cnt.

- Density of Digraph:
 - Number of all possible edges in Digraph?
 - $N * (N-1)$

$$\frac{E}{N * (N - 1)}$$

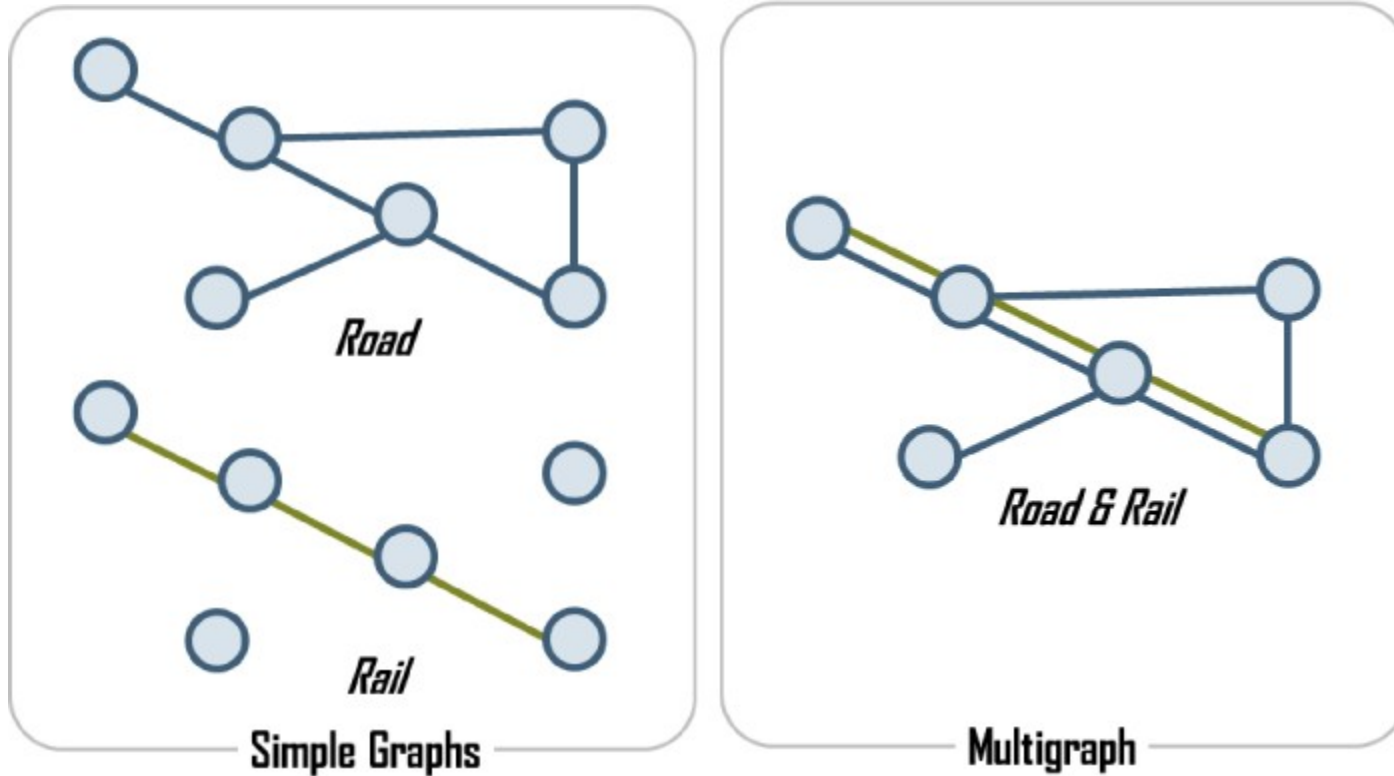

Graph Types- Digraphs- Cnt.

- Connectivity
 - Walks
 - Trails
 - Paths
- The same as before just links are directed!

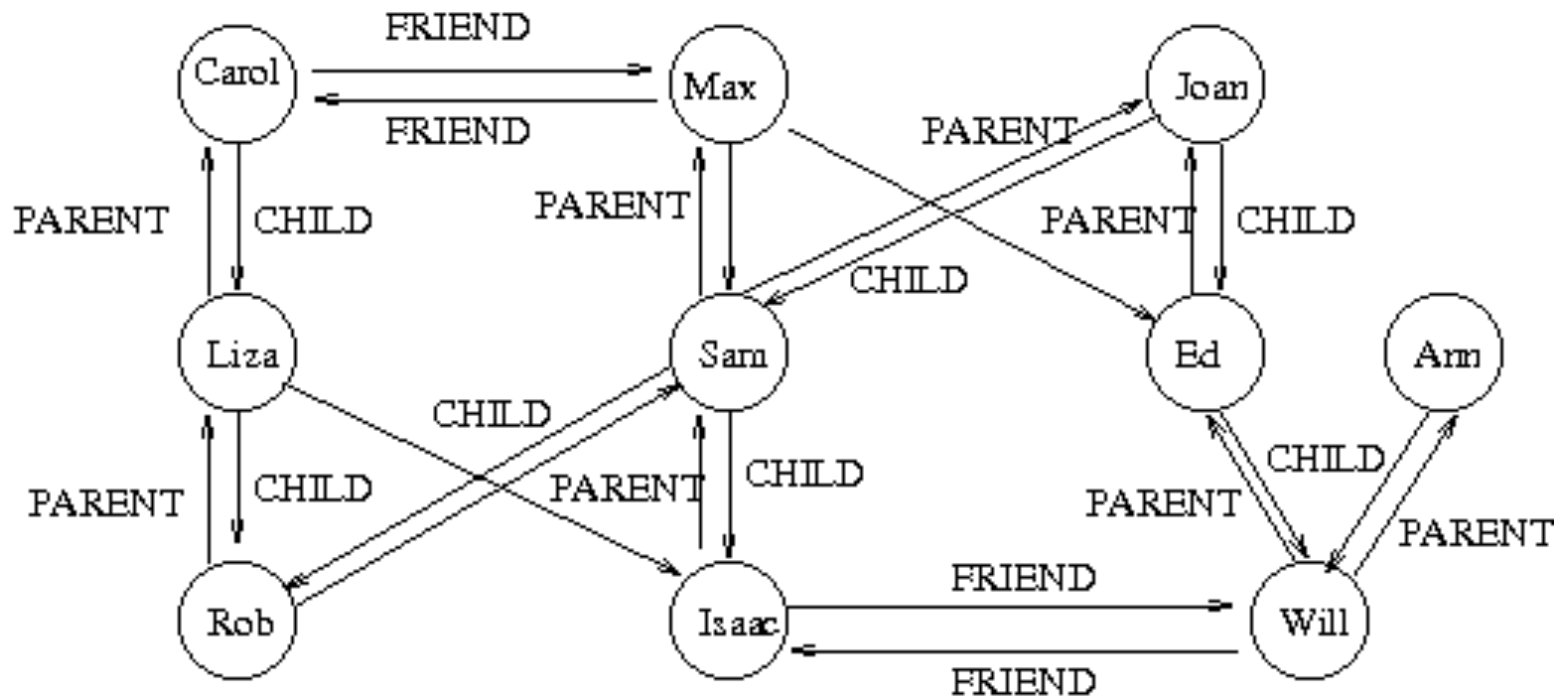

Graph Types- Multigraphs

- A Multigraph (or multivariate graph) G consists of:
 - a set of nodes, *and*
 - two or more sets of edges, $E^+ = \{E_1, E_2, \dots, E_r\}$, r is the number of edge sets.

Multigraph 1.

Multigraph 2.

Graph Types- Multigraphs- Cnt.

- Each E_i indicated one type of relationship, e.g.:
 - E_1 : lives near relationship
 - E_2 : friends at the beginning of the year
 - E_3 : friends at the end of the year

Graph Types- Multigraphs- Cnt.

- Number of edges btw any two nodes in a multigraph?
 - $E^+ = \{E_1, E_2, \dots, E_r\}$, r is the number of sets of edges
 - Undirected multigraph
 - $[0, r]$
 - Directed multigraph
 - $[0, 2*r]$

Graph Types- Hypergraphs

- A hypergraph is a graph in which an edge can connect any number of nodes.
- In a hypergraph, E is a set of non-empty subsets of N called *hyperedges*.

Graph Types- Hypergraphs- Cnt.

- A hypergraph is a graph in which an edge can connect any number of nodes.
- In a hypergraph, E is a set of non-empty subsets of N called *hyperedges*.

$$N = \{v_1, v_2, v_3, v_4, v_5, v_6, v_7\}$$

$$E = \{e_1, e_2, e_3, e_4\} =$$

$$\{\{v_1, v_2, v_3\}, \{v_2, v_3\}, \{v_3, v_5, v_6\}, \{v_4\}\}$$

Graph Types- Hypergraphs- Cnt.

- Applications:
 - Recom. systems (communities as edges),
 - Image retrieval (correlations as edges),
 - Bioinformatics (interactions or semantic types as edges).

$$\mathbf{N} = \{v_1, v_2, v_3, v_4, v_5, v_6, v_7\}$$

$$\mathbf{E} = \{e_1, e_2, e_3, e_4\} =$$

$$\{\{v_1, v_2, v_3\}, \{v_2, v_3\}, \{v_3, v_5, v_6\}, \{v_4\}\}$$

Weighted/Signed Graphs

- Edges may carry additional information
 - Tie strength → how good are two nodes as friends?
 - Distance → how long is the distance btw two cities?
 - Delay → how long does the transmission take btw two cities?
 - Signs → two nodes are friends or enemies?
